

DJI Super Patcher Program Crash Solved

2024-06-05 The two busybox.exe files in the Super Patcher program are out of date. Not only that but they were designed to run on 32-bit machines (but they say it "should run OK") but I kept getting a message from Windows 10 that **"Busybox.exe cannot be run on your machine. Contact the software company for assistance"**. The program also opens then immediately slams shut.

Frippery.org has two downloads of Busybox.exe but one is a 64 bit version called "Busybox64.exe". I used this one to get Super Patcher working again. I deleted the "busybox.exe" in the Super-patcher root file and also in the "Super-Tools-2.0" file (there are TWO of these .exe files and BOTH need to be replaced) folder and replaced it with the "Busybox64.exe" in both locations (I renamed it "busybox.exe"). Super-Patcher 2.0 will then come back to life.

Getting Started on the repair

The Super Patcher 2.0 program is downloaded from Github and needs to be "un-zipped". Once that is done, go into the root folder and look for the Busybox.exe file and delete it. Download the Busybox64.exe file from frippery.org and paste it right back into the root file. Next, rename the file to "busybox.exe" (omitting the "64").

Now run the "DJI_Super-PatcherV2.0.2.cmd" and a cmd window should appear. The program will automatically go to Github and download the necessary files to add to the program folder. Part of this download is ANOTHER copy of the busybox.exe in the "Super-Tools-

2.0” folder. Delete that one as well and copy and paste the busybox64.exe you re-named to “busybox.exe” in its place in the same folder.

This will complete the repair/upgrade to the Super Patcher 2.0 program and it should now be fully functional.

This community gives so much for us, I'm glad I can give something back.

If the link does not work, its posted on their webpage...

I bow to the Github OG gods that hacked the DJI firmware.

They are truly the hero's here.
