Neural Network Training

Geena Kim

Learning in perceptron

- Perceptron rule
- Delta rule (Gradient Descent)

Perceptron algorithm

- Cycle through the training instances
- Only update W on misclassified instances
- If instance misclassified:
 - If instance is positive class (positive misclassified as negative)

$$W = W + X_i$$

If instance is negative class (negative misclassified as positive)

$$W = W - X_i$$

Perceptron

Delta rule (Gradient Descent)

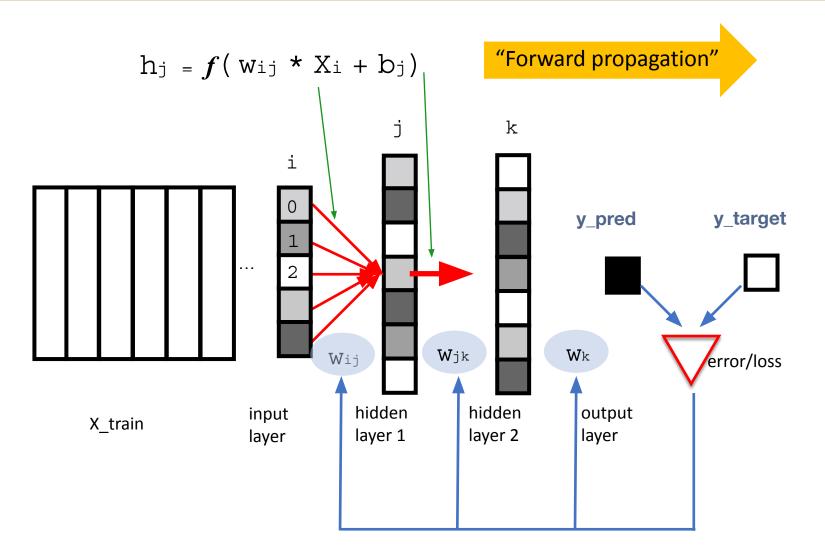

$$\omega_j \leftarrow \omega_j - \alpha \frac{\partial \mathcal{L}}{\partial \omega_j}$$

$$\mathcal{L} = \frac{1}{2}(\hat{y}_i - y_i)^2$$

$$\hat{y}_i = \sum_j \omega_j X_{ij}$$

$$\omega_j \leftarrow \omega_j - \alpha(\hat{y}_i - y_i) X_{ij}$$

How Neural Network Training Works

"Backward propagation"

$$W_{ij} \leftarrow W_{ij} - \alpha \frac{\partial \mathcal{L}}{\partial W_{ij}}$$

Weight Update Rule

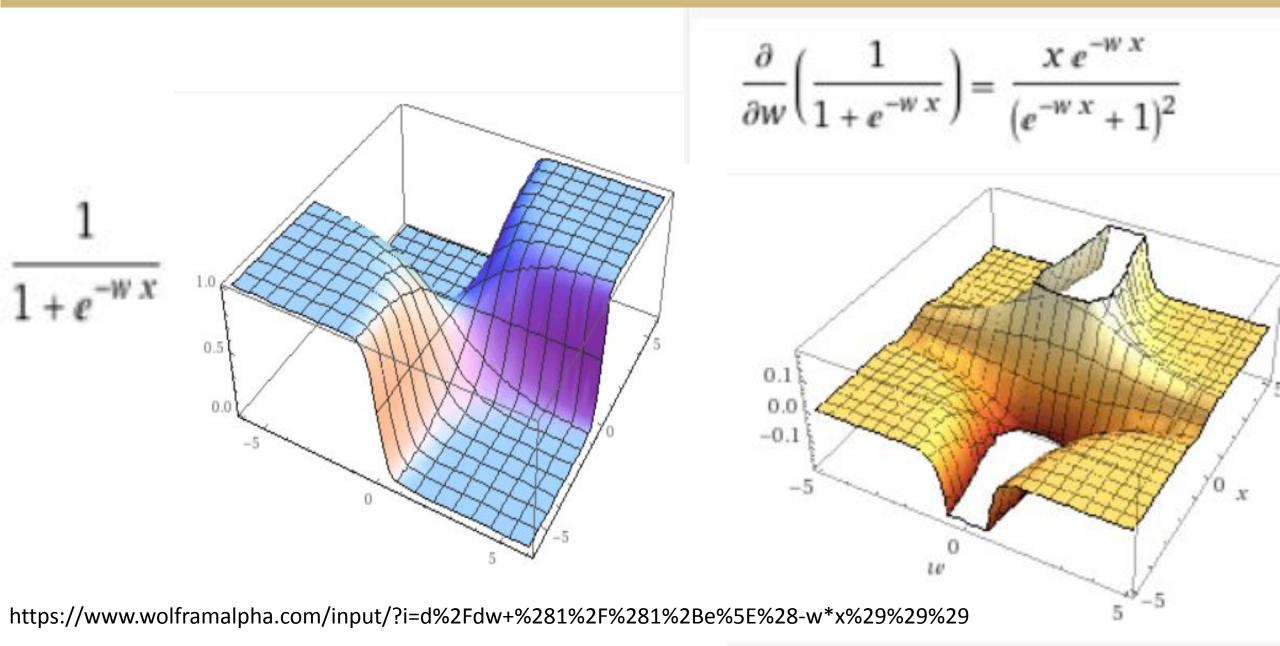

Loss Function Gradient (Chain Rule) Back Propagation

Chain Rule Reminder

 $\frac{\partial f(g(x))}{\partial x} = \frac{\partial f}{\partial g} \frac{\partial g}{\partial x}$

Example: gradient of sigmoid

Chain Rule Reminder

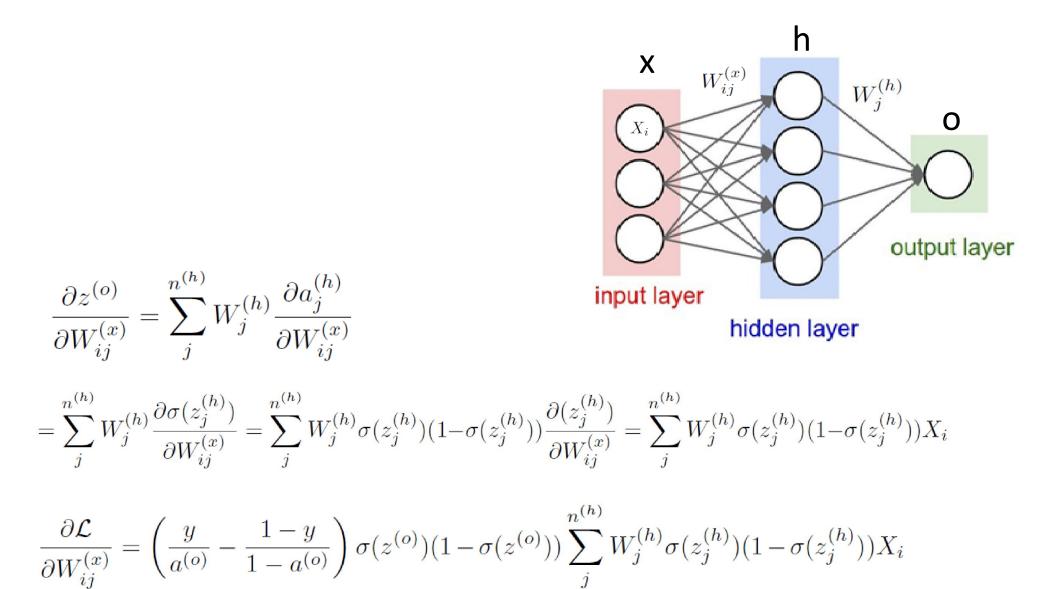

Calculating Gradient- Chain Rule

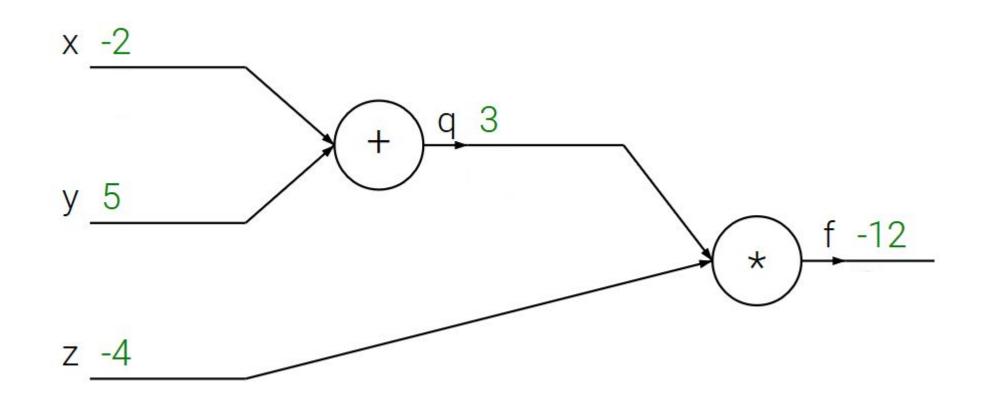

$$\begin{aligned} \frac{\partial \mathcal{L}}{\partial W_{ij}^{(x)}} &= \frac{\partial \mathcal{L}(a^{(o)})}{\partial a^{(o)}} \frac{\partial a^{(o)}}{\partial W_{ij}^{(x)}} \\ &= \left(\frac{y}{a^{(o)}} - \frac{1 - y}{1 - a^{(o)}}\right) \frac{\partial a^{(o)}}{\partial W_{ij}^{(x)}} \\ \frac{\partial a^{(o)}}{\partial W_{ij}^{(x)}} &= \frac{\partial \sigma(z^{(o)})}{\partial z^{(o)}} \frac{\partial z^{(h)}}{\partial W_{ij}^{(x)}} \\ &= \frac{\partial \sigma(z^{(o)})}{\partial z^{(o)}} \frac{\partial z^{(o)}}{\partial W_{ij}^{(x)}} = \sigma(z^{(o)})(1 - \sigma(z^{(o)})) \frac{\partial z^{(o)}}{\partial W_{ij}^{(x)}} \end{aligned}$$

Calculating Gradient- Chain Rule

Back Propagation- Computation Graph

q = x+y f = q*z

Back Propagation- Computation Graph
