

Photo Notes are in the wrong place

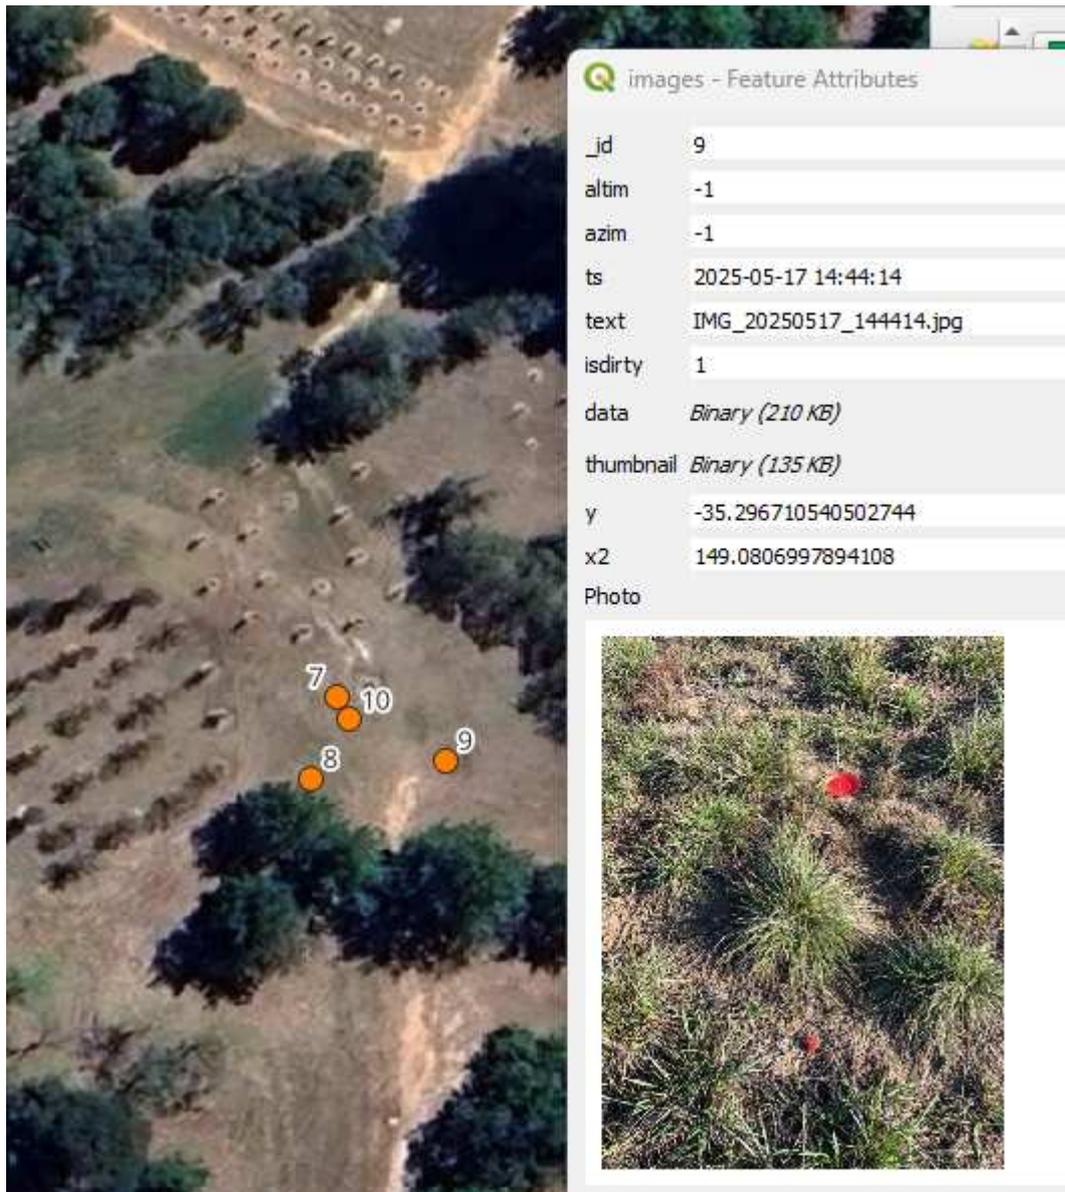

Point 1 is in the correct place, at least visually.

Points 4,5 are not correct, but I may have been there on the day.

Points 9,10 are not correct and are in a place that I did not go to on the day.

All of the points should be on the gps track, which I recorded as I was surveying the grassland. The track is not too bad, as I used it to retrace my steps in the field.

The image data in the blobs in the geopackage is okay. It is just the coordinates that are not correct. The coordinates are not correct in the gpad file. If I use SQL to join the timestamps in the images to the timestamps in the gpslogsdata, then I get the following, which is correct within the resolution of the track log data.
