

M

# GRNsight v7: a web application for visualizing gene regulatory networks and protein-protein interactions

Ngoc Kim Ngan Tran & Milka Zekarias  
Department of Computer Science  
Loyola Marymount University

Southern California Conference for Undergraduate Research  
November 22, 2025

1

you need to read the outline M

don't leave 1 word by itself on a line M

### Outline

- Gene Regulatory Networks (GRN) consist of genes, transcription factors, and the regulatory connections between them
- Protein-Protein Interactions (PPI) are the binding relationships between proteins
- GRNsight is an open source visualization tool that allows for easier modeling of GRNs and PPIs
- GRNsight transitioned our database source from YeastMine to AllianceMine
- GRNsight has improved PPI support for node coloring
- GRNs have directed edges to indicate regulatory relationships (activation or repression), with edge thickness indicating regulation strength. PPIs have undirected edges to indicate physical binding
- New graph functionality allows users to restrict the graph to the viewport.
- GRNsight switched CI tools from Travis CI to Github Actions

- GRNsight switched CI tools from Travis CI to Github Actions

repeated too

3

### Gene expression is the flow of information in a cell from DNA to RNA to the final protein

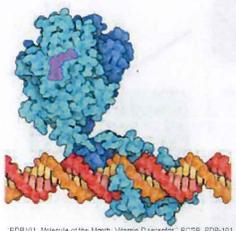

make image bigger

4

line break M

### Regulatory Transcription Factors bind to DNA and turn on (activate) or turn off (repress) gene expression

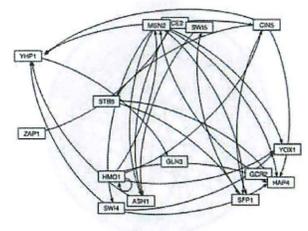

- In yeast, ~250 regulatory transcription factors regulate ~6000 genes.
- In humans, ~500 regulatory transcription factors regulate ~20,000 genes.

FDB101: Molecule of the Month: Vitamin D Receptor. RCSB: PDB-101. <https://doi.org/10.26434/chemrxiv-2015-01-01>

5 say that this is a picture of a transcription factor binding to a gene

M

### A Gene Regulatory Network (GRN) consists of genes, transcription factors and the regulatory connections between them which govern the level of expression of mRNA and protein from genes

FDB101: Molecule of the Month: Vitamin D Receptor. RCSB: PDB-101. <https://doi.org/10.26434/chemrxiv-2015-01-01>

6 say each node represents a regulatory transcription factor + each edge is a regulatory relationship

### GRNsight is part of an open science ecosystem

With thanks to John Jungck

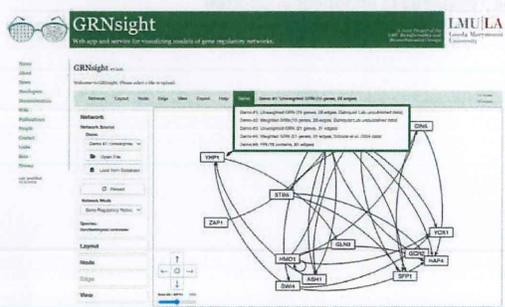

### GRNsight rapidly generates graphs using customizations to the Open Source D3 Library

13

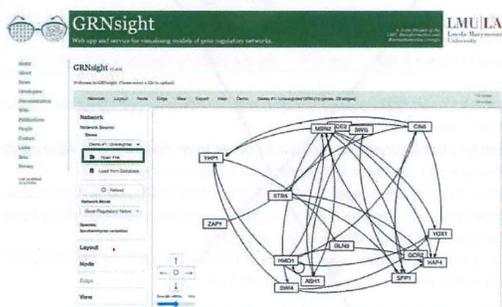

14

### To get started quickly, GRNsight also provides different demos

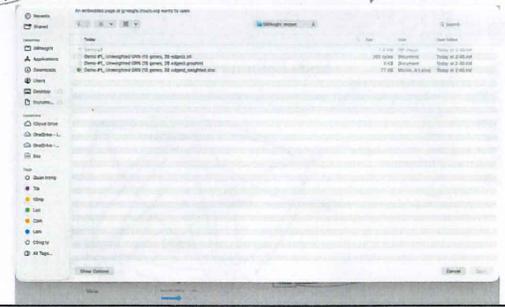

15

### Users can import networks via File Upload

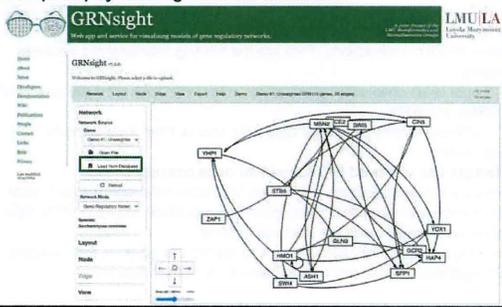

16

### The imported file need to be in supported format (SIF, GraphML and Excel)

17

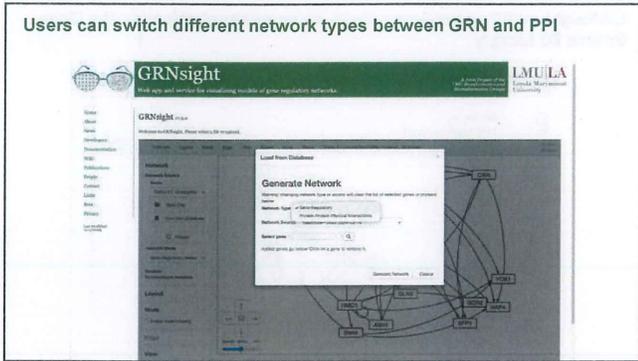

### Users can construct custom networks from Saccharomyces Genome Database (SGD) by loading from our database

**Users can choose different expression database for node coloring**

**GRNsight**

Network Legend Nodes

45

*previously*

**Node coloring was only enabled for GRNs because node coloring is a visualization of the level of mRNA expression**

**GRNsight**

Node coloring is default to be off for PPIs

46

**Version 7.2 allows node coloring for PPIs but with warnings, as it is showing mRNA level data on a node representing a protein**

**GRNsight**

Warning

47

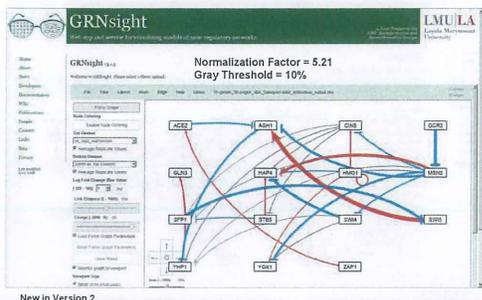

**Outline**

- Gene Regulatory Networks (GRN) consist of genes, transcription factors, and the regulatory connections between them
- Protein-Protein Interactions (PPI) are the binding relationships between proteins
- GRNsight is an open source visualization tool that allows for easier modeling of GRNs and PPIs
- V7 - GRNsight transitioned our database source from YeastMine to AllianceMine
- GRNsight has improved PPI support for node coloring
- GRNs have directed edges to indicate regulatory relationships (activation or repression), with edge thickness indicating regulation strength. PPIs have undirected edges to indicate physical binding
- New graph functionality allows users to restrict the graph to the viewport.
- GRNsight switched CI tools from Travis CI to Github Actions

75

76

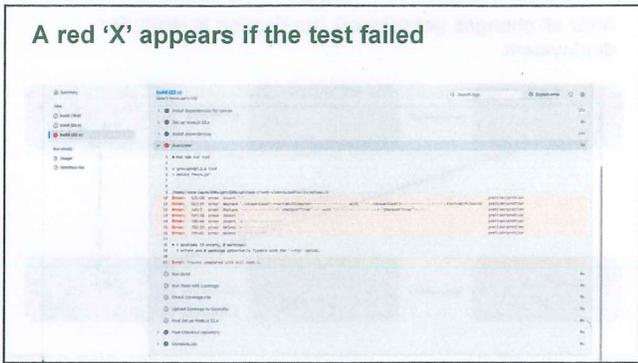

77

78

*Use workflow slide instead*

79

**Summary**

- Gene Regulatory Networks (GRN) consist of genes, transcription factors, and the regulatory connections between them
- Protein-Protein Interactions (PPI) are the binding relationships between proteins
- GRNsight is an open source visualization tool that allows for easier modeling of GRNs and PPIs
- GRNsight transitioned our database source from YeastMine to AllianceMine
  - Due to YeastMine is no longer supported
- GRNsight has improved PPI support for node coloring
  - PPI is supported node coloring with warning that it is showing mRNA level data on a node representing a protein

80

*Streamline to fit on one slide*

*References need provide*

**Summary**

- GRNs have directed edges to indicate regulatory relationships (activation or repression), with edge thickness indicating regulation strength. PPIs have undirected edges to indicate physical binding.
- New graph functionality allows users to restrict the graph to the viewport.
  - Users can drag, zoom, and move the graph with nodes staying within the application's bounding box, improving user control of the graph
- GRNsight switched CI tools from Travis CI to Github Actions
  - No external connection needed for Github Actions because it's native to Github
  - Allow testing against multiple version of JavaScript *Node*
  - Integrating workflows for automated builds, unit tests, and linting to streamline development processes and improve maintainability of the code

81

*Reference need provide*
