

Questions

1 Context

I am working on an **add-on plugin** for GiveWP (Version 4.13.1):

`givewp-custom-fields-and-filters`

Goal: extend the *"Add Manual Donation"* functionality to:

- Add additional fields to donations and donors
- Save these fields in GiveWP metadata
- Display these fields in admin listings and donation details
- Add filters for these fields in the admin interface

I want to **do everything via GiveWP hooks and filters**, without touching the core.

2 What currently works

- The **custom fields appear correctly in the manual donation creation form** (category, transaction number, anonymous donation, hidden donation, attachment)
 - The UI works: fields can be filled, files uploaded, checkboxes checked.
-

3 What does not work

- After saving, the values are **not visible**:
 - in **donation listings**
 - in **individual donation details**
 - in **custom columns**
 - in **filters**
 - I don't know **which hooks to use to make the data visible** in GiveWP Version 4.13.1 with the **Manual Donations plugin v1.8**
 - The filters and columns I have tried **do not appear** or do not filter correctly.
-

4 Specific question

For GiveWP 4.13.1 and Manual Donations plugin v1.8:

1. Which hooks or filters should I use to:
 - Display my custom fields in **donation listings** and **donor details**?
 - Add my fields as **visible columns** in admin tables?
 - Add **filters for these fields** that interact correctly with GiveWP queries?
2. What is the best way to **save my custom fields** so that everything is compatible with:
 - CSV export
 - Recurring donations
 - PDF receipts
 - Stripe
3. Should I use `give_payment_meta`, or another specific meta system to ensure full compatibility with GiveWP and the Manual Donations plugin?
4. **I'm giving you my plugin's code file in the attached file.**
