

# Untitled

This file illustrates a problem with using `md()` inside a table column heading in `gt` 1.3.0 that causes the rest of the table to be placed off the page.

This code works as expected and produces [Table 1](#):

```
library(gt)

countrypops |>
  head(10) |>
  gt() |>
  cols_label(country_code_2 ~ "country code")
```

But if we use `md()` to break a long column name over multiple lines, the column is assigned the width of `\linewidth` so the rest of the table disappears off the right margin ([Table 2](#)):

```
countrypops |>
  head(10) |>
  gt() |>
  cols_label(country_code_2 ~ md("country<br>code"))
```

Table 1: Works as expected

country_name	country code	country_code_3	year	population
Aruba	AW	ABW	1960	54922
Aruba	AW	ABW	1961	55578
Aruba	AW	ABW	1962	56320
Aruba	AW	ABW	1963	57002
Aruba	AW	ABW	1964	57619
Aruba	AW	ABW	1965	58190
Aruba	AW	ABW	1966	58694
Aruba	AW	ABW	1967	58990
Aruba	AW	ABW	1968	59069
Aruba	AW	ABW	1969	59052

Table 2: Does not work as expected

country_name	country code
Aruba	AW
Aruba	AW
