

Code-fold default in PDF

I have written a textbook that I want to render to both HTML and PDF. The HTML version contains some folded code chunks, which means that readers of the HTML version have the option of clicking to view the code underlying a figure, for example, as in:

```
plot(1:10)
```

When I render to PDF, the code folds are ignored and the code is always printed. I would like the default to be the other way around: if a folded code chunk is rendered to PDF then the code should *not* be printed. How can I achieve this?
